Case study 1

Portfolio selection

- Select a portfolio package from a set of alternative investments
- Maximization of the expected return or minimization of the risk
- Available capital
- Company's policy
- Duration of investments' economic life, potential growth rate, danger, liquidity

Return data

Expected annual return of investments

| Investment | Expected annual return rate (%) |
|------------------------------------|---------------------------------|
| Share A – manufacturing sector | 15.4 |
| Share B - manufacturing sector | 19.2 |
| Share C - food and beverage sector | 18.7 |
| Share D – food and beverage sector | 13.5 |
| Mutual fund E | 17.8 |
| Mutual fund Z | 16.3 |

Requirements

- Total amount = € 90000
- Amount in shares of a sector no larger than 50% of total available
- Amount in shares with the larger return of a sector less or equal to 80% of sector's total amount
- Amount in manufacturing company B less or equal to 10% of the whole share amount
- Amount in mutual funds less or equal to 25% of the amount in manufacturing shares

Solution

Decision variables

x_1 = invested amount in share A of the manufacturing sector

x_2 = invested amount in share B of the manufacturing sector

x_3 = invested amount in share C of the food and beverage sector

x_4 = invested amount in share D of the food and beverage sector

x_5 = invested amount in mutual fund E

x_6 = invested amount in mutual fund Z

Case Study 2

Financial programming problem

- Initial amount: € 80000
- Timeframe of investments' decisions: 4 months
- Two-month government bonds: return 3%
- Three-month government bills: return 6.5%
- Bank deposits: interest 1%
- At the beginning of the 5th month at least € 40000 are needed
- Maximum amount in two-month or three-month bonds: € 32000

Decision variables

B_j = amount to be invested in government bonds at the beginning of the month j

C_j = amount to be invested in government bills at the beginning of the month j

D_j = amount to be invested in bank deposits at the beginning of the month j

Case Study 3

Investment choice problem in a limited capitals status

- There are five independent investments
- Maximization of the total present net value
- Satisfaction of budget limitations
- Cash inflows of the investments
- Cash outflows of the investments
- Each investment is divisible (investment rate)

Inflow data

Cash inflows

| Year | Investment | | | | |
|------|------------|----|----|----|----|
| | 1 | 2 | 3 | 4 | 5 |
| 1 | 38 | 11 | 17 | 8 | 25 |
| 2 | 41 | 16 | 24 | 11 | 28 |
| 3 | 54 | 15 | 29 | 13 | 35 |
| 4 | - | 20 | - | 19 | 46 |

Outflow data

Cash outflows

| Year | Investment | | | | | Amount Available |
|------|------------|----|----|---|----|------------------|
| | 1 | 2 | 3 | 4 | 5 | |
| 0 | 34 | 10 | 16 | 9 | 31 | 55 |
| 1 | 13 | 5 | 8 | 4 | 10 | 28 |
| 2 | 14 | 6 | 10 | 6 | 13 | 30 |
| 3 | 17 | 6 | 11 | 7 | 12 | 37 |
| 4 | - | 8 | - | 5 | 16 | 30 |

Case study 4

Advertising media selection

Problem data

| Advertising media | Cost of one view (in €) | Units of expected audience rate of one view |
|---------------------|----------------------------|--|
| 1. Friday – day | 400 | 5000 |
| 2. Saturday – day | 450 | 5500 |
| 3. Sunday – day | 450 | 5700 |
| 4. Friday – night | 500 | 7500 |
| 5. Saturday – night | 550 | 8200 |
| 6. Sunday - night | 550 | 8400 |

Other relative elements

- Goal: Determination of views / records in order to maximize the total audience rate
- Total available amount: € 45000
- Maximum amount for Friday: € 11000
- Maximum amount for Saturday: € 14400
- Total daily view number: at least 20
- Total nightly view number: at least 50% of the total
- Maximum view number: each day 12, each night 18

Decision variables

X_1 = number of views on Friday (day)

X_2 = number of views on Saturday (day)

X_3 = number of views on Sunday (day)

X_4 = number of views on Friday (night)

X_5 = number of views on Saturday (night)

X_6 = number of views on Sunday (night)

Case study 5

Marketing research

- Personal interviews, Daily (D) and Nightly (N)
- Households: with children, without children, of one person
- Sample = 800 households
- At least: 400 with children, 200 without children, 100 of one person
- Respondents Night \geq Respondents Day
- To be done during:
 - At least 50% of interviews to households with children
 - At least 60% of interviews to households without children
 - At least 70% of interviews to households of one person

Cost elements

Interview cost (in monetary units)

| Household category | Day | Night |
|--------------------|------|-------|
| With children | 1500 | 1800 |
| Without children | 1300 | 1600 |
| One person | 1000 | 1200 |

Decision variables

x_{11} = Number of interviews to households with children carried out during the day

x_{12} = Number of interviews to households with children carried out during the night

x_{21} = Number of interviews to households without children carried out during the day

x_{22} = Number of interviews to households without children carried out during the night

x_{31} = Number of interviews to households of one person carried out during the day

x_{32} = Number of interviews to households of one person carried out during the night

Case study 6

Human resources management

- Allocation of available human resources to different departments, work centers, shifts etc.
- Recruitment of seasonal staff
- Allocation of staff to shifts
- Minimizing the number of employees who should work in various time periods during the day

Problem's data

| Time period | Shift | | | | | Minimum number of required employees |
|------------------------------------|-------|-----|-----|-----|-----|--------------------------------------|
| | 1 | 2 | 3 | 4 | 5 | |
| 07 a.m. – 09 a.m. | + | | | | | 35 |
| 09 a.m. – 11 a.m. | + | + | | | | 68 |
| 11 a.m. – 13 p.m. | + | + | | | | 60 |
| 13 p.m. – 15 p.m. | + | + | + | | | 57 |
| 15 p.m. – 17 p.m. | | + | + | + | | 65 |
| 17 p.m. – 19 p.m. | | | + | + | | 63 |
| 19 p.m. – 21 p.m. | | | + | + | | 72 |
| 21 p.m. – 23 p.m. | | | | + | | 33 |
| 23 p.m. – 07 a.m. | | | | | + | 12 |
| Gross employee cost per day (in €) | 230 | 220 | 225 | 240 | 260 | |

Case study 7

Production planning

- Planning horizon: A number of time periods
- Problem: Having a forecast for each period's demand, determine the products' quantities that can be produced with feasible methods in order to satisfy the total demand with the minimum cost.
- For two products A and B, there are demand forecasts for January, February and March.
- Initial stock: 100 units of product A and 120 units of product B.
- Minimum total required stock: 130 units of product A and 110 of product B
- Unit production cost: $A = € 20$ and $B = € 25$
- Maintenance cost per period and per unit: 2% on the unit production cost

Demand

Bicycle demand

| Month | Bicycle | |
|----------|---------|-------|
| | A | B |
| January | 700 | 800 |
| February | 900 | 600 |
| March | 1000 | 900 |
| Total | 2600 | 2.300 |

Capacity

System's capacity

| Month | Machine capacity (machine hours) | Available work (man-hours) |
|----------|-------------------------------------|-------------------------------|
| January | 3000 | 2500 |
| February | 2800 | 2300 |
| March | 3600 | 2400 |

Use of resources

Required resources per product unit

| Bicycle | Machine hours | Man-hours |
|---------|---------------|-----------|
| A | 1.5 | 1.1 |
| B | 1.6 | 1.2 |

Decision variables

x_{IJ} = number of units of product I produced during month J,
where I = A, B and J = 1, 2, 3

I_{IJ} = number of units of product I maintained in stock at the end of the month J,
where I = A, B and J = 1, 2, 3

J = 1 – January

J = 2 – February

J = 3 – March

Case study 8

Diet problem

- Identification of a diet or of a prescription meeting specific dietary requirements
- Criterion: minimum cost

X_j = the amount of ingredient j for the production of one unit of animal feed

Problem's data

| Required nutritional ingredient | Number of nutritional ingredients per ingredient unit | | | | Nutritional requirement per animal feed unit |
|---------------------------------|---|-----|-----|-----|--|
| | Ingredient | | | | |
| | 1 | 2 | 3 | 4 | |
| Vitamin A | 80 | 115 | 100 | 90 | ≥ 80 |
| Vitamin C | 110 | 90 | 85 | 100 | ≥ 100 |
| Vitamin E | 50 | 70 | 105 | 80 | ≥ 60 |
| Proteins | 250 | 300 | 210 | 240 | ≥ 260 |
| Calories | 480 | 510 | 470 | 530 | ≤ 2300 |
| Unit cost | 180 | 160 | 145 | 200 | |

Case study 9

Mix problem

- Determination of the best mix program of raw material for the production of final products
- Three main ingredients A, B and C
- Three products: super fuel, unleaded, super unleaded
- Minimum required octane number
- Maximization of the total daily profit
- Available quantities of main ingredients
- Minimum required product quantities

Problem's data

| Main ingredient | Octane number | Cost per ton (€) | Maximum daily available quantity (tones) |
|-----------------|---------------|------------------|--|
| A | 120 | 38 | 1000 |
| B | 90 | 42 | 1200 |
| C | 130 | 105 | 700 |

Demand data

| Fuel | Octane number | Cost per ton (€) | Daily demand (tones) |
|------|---------------|------------------|----------------------|
| A | 94 | 85 | 800 |
| B | 92 | 80 | 1100 |
| C | 96 | 88 | 500 |

Decision variables

X_{ij} = quantity of ingredient i mixed for the production of one tone of product j

for $i = A, B, C$ and $j = 1, 2, 3$

$j = 1$ – fuel super

$j = 2$ – unleaded fuel

$j = 3$ – super unleaded fuel
